Project | Sustainability Impact Analysis for Intel

Part 1: Organizing and Understanding the Data

How many columns take on numeric values?

How many columns take on text values?

Calculate the age of each device by subtracting the `model_year` from 2024. Enter your formula in the cell next to the `model_year` column and name it `device_age`. Then, sort the data by `device_age` and double check that the values make sense. For example, a 2019 device should be older than a 2023 device.

Sort the data by `model_year` (oldest to newest). Do you notice more older (5+ years) or newer (under 5 years) devices being repurposed? What might that indicate?

It's interesting to note that there are significantly more newer cars (4+ years old) than older ones being repurposed. This may be because consumers are becoming more conscious about their carbon footprint, or there's been an economic downturn, or that older vehicles may no longer be functional. Any one of these is worth further investigation.

Part 2: Key Insights

What is the total number of devices Intel repurposed in 2024? Note: the data table is named `impact_data`.

Using the `AVERAGE()` function, what is the average age of repurposed devices in 2024?

What is the average estimated energy savings (kWh) from repurposed devices per year compared to new devices?

What is the total CO2 emissions saved (in tons) from repurposed devices?

Now that you have calculated the average estimated energy savings (kWh) and CO2 emissions saved, can you use ChatGPT to help put these numbers into perspective?

ChatGPT: I found that each repurposed device saves approximately XXX kWh of energy per year and Intel's program saved XXX tons of CO2 emissions in one year. Help me understand the significance of these numbers. How does this compare to the energy consumption of a small city or the amount of CO2 produced by cars? What is the global impact of these savings?

ChatGPT: What comparisons did you find most impactful in terms of scale? Summarize how much energy and CO2 emissions were saved and how it compares to something familiar, like powering households or reducing deforestation.

Part 3: Deeper Patterns and Trends

Using the `COUNTIF()` function, how many laptops were repurposed?

Using the `COUNTIF()` function, how many desktops were repurposed?

Using the `AVERAGEIF()` function, what is the average energy savings for repurposing laptops?

Using the AVERAGEIF() function, what is the average energy savings for repurposing desktops?

Fill out the summary table to the right. In the column n_devices, use the COUNTIF() function to count of devices with each device_age. In the avg_energy_saved column, use the AVERAGEIF() function to c average energy saved for each device_age.

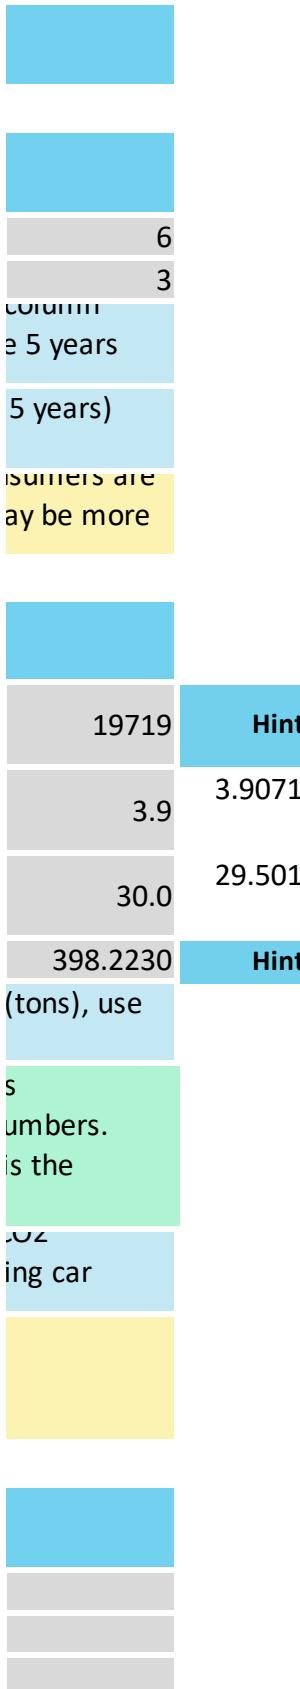

Looking at the summary table, what do you notice about the relationship between device age and the devices repurposed versus the average energy saved?

Part 4: Data-Driven Recommendations

Based on your analysis of the repurposed devices (including energy savings, CO₂ emissions, and device age), write four key takeaways in succinct sentences that summarize the most important patterns and insights from the data. These should be specific, concise, and focused on the implications of repurposing newer versus older devices.

Based on your four key takeaways and ChatGPT as your teammate, write a recommendation for Intel to use the data to improve the repurposing program. Your recommendation should include a clear action or strategy for Intel to take on the data and a data-driven justification for why this approach would maximize energy savings and CO₂ reductions.

Briefly reflect on how ChatGPT's suggestions influenced your recommendation. Did it help you see something you hadn't considered? What parts of your recommendation were improved based on its response?

Hint!

Data Dictionary

Description

Unique identifier for each repurposed device

Type of device, values are either "Laptop" or "Desktop"

The year the device was manufactured (e.g., 2018, 2019, etc.).

Power consumption of the device in watts (W) when in use (e.g., 50W, 75W).

Estimated energy savings per device per year when repurposed compared to a new device, measured in kilowatt hours (kWh).

Estimated CO₂ emissions saved per device per year from manufacturing a new device, measured in tons.

The geographical region where the device was repurposed, values are "North America", "Europe", and "Asia"

The age of the device at the time it was repurposed, calculated as the difference between the current year and the year it was manufactured.

The percentage of the device that is recyclable
